F. UXO Search

1. INTRODUCTION

This report presents the results of a geological desk study, field investigations and in-situ testing undertaken both historically and for the purposes of this report.

The majority of the Felindre Meadows development area has been extensively investigated. A preliminary site investigation was carried out by Integral Geotechnique Ltd, under the supervision of Ove Arup and Partners in 1991 as part of the Sony Development.

A further extensive site investigation was carried in 2005 by Messrs Soil Mechanics Ltd, specifically for the development of Pencoed Technology Park. The Investigation covered the area now designated as Plot F, within which this proposed development will be undertaken. Information from this report has been utilised and referenced accordingly.

2. THE SITE

2.1 Location and Description

Plot E is located within the Felindre Meadows Development Area, otherwise known as Pencoed Technology Park. The overall development is situated to the North-East of Junction 35 of the M4 motorway, and East of Pencoed Town Centre.

Plot E is one of a number of development plots located within the Felindre Meadows development scheme.

The OS Grid Reference of the site is **SS97193 80900** and the site covers approximately 6.37 acres, with a developable plateau measuring approximately 1.1 acres. The topography is relatively flat, sloping very gently towards the North, with a level, pre-graded development plateau positioned generally against the southern boundary. The plot is bounded to the North, East and West by hedges, and to the south by stock fencing.

2.2 Archaeological History

An initial archaeological search has shown that the general region is historically rich.

An assessment of the potential for significant archaeological remains within the site, undertaken in 1991, is presented in the appendices.

2.3 Recent History

The recent history of the Felindre Meadows Development site has been studied on old Ordnance Survey Maps dating from 1877 and on aerial photographs since I946.

In 1877, the land was generally undeveloped, consisting of open fields. Felindre, Bryn-Cwtyn and Pant Ruthin Fawr Farms already existed, and the access tracks had also been constructed. A system of footpaths and footbridges traversed the site. In the north- east corner, the district boundary followed the centre of a linear hollow feature, and the Ewenny Fach River was unusually straight in this area. This suggests that the river had been straightened prior to 1877 and the hollow is probably the old river course. An artificially cut off meander can also be seen on the 1877 plan to the east of Bryn-Cwtyn on the Ewenny River. No further

development had occurred on the site by 1920, although the abandoned meander course was shown indistinctly and presumably was virtually obliterated.

By 1946, two very small buildings had been constructed near field boundaries on the eastern side of the site. These were probably small barns or sheds for agricultural use.

Jn 1954, earthworks were being carried out in the north of the site, marking the construction of Pencoed Cemetery.

By 1979, the new M4 motorway had been constructed in the south, the A473 has been built in the west; Felindre Road had been constructed in the north and realigned in the east. The two small barns/sheds had been dismantled. Bryn-Cwtyn Farm had been demolished by this time, but a small additional building had been constructed in the south-east.

In 1991 /1992 the existing Sony factory was developed across agricultural land to the west. The scheme included the construction of a surface car park in the western area of the site. As part of this development, ponds were formed to the south and south-west of the factory, and an access road, service station, hotel and fast food restaurant was built in the south-west corner of the area.

The construction of a new roundabout junction on Felindre Road to serve the new development of Pencoed Technology Park commenced in April 2006.

The proposal involved the construction of a new industrial access road into the new development and the provision of a new footway/cycleway from the Bridgend County Borough Council border to the development along the existing Felindre Road

Following completion of a series of development plateaus, subsequent development commenced with the construction of the Ortho Clinical Diagnostics research and development facility, currently occupied by the Johnson & Johnson Company.

Further development followed with the construction of a new Office building for South Wales Police Authority.

2.4 Published Geology

The published geological maps covering the site, BGS Sheet 261 and 262 Bridgend (1974) shows the solid geology to comprise Triassic mudstones overlain by superficial deposits comprising River Gravels.

2.5 Natural Cavities and Abandoned Mining

During the late 1980's, the Department of Environment commissioned geographical reviews on the influence of natural cavities and abandoned mine workings on ground surface stability (carried out by Applies Geology and Arup Geotechnics respectively).

Records of six natural cavities have been found within 2km of the site, although none are within the site boundary itself. The cavities were mostly "sink holes", recorded in areas where Carboniferous Limestone directly underlies the glacial sands. However, a sink hole in the Triassic Conglomerate was recorded at an opencast coal site east of Llanilid.

The abandoned mine workings database contains no records of workings beneath the site itself. The nearest recorded mine entrance was a small lead mine near to Ruthin, about 400m south of the site and within the Carboniferous Limestone. Furthermore, the geological

environment of the site is such that the likelihood of unrecorded mine workings is considered negligible.

3. PROPOSED DEVELOPMENT

The proposed development comprises of the construction of 16 light industrial units, built in 3 blocks in a courtyard type layout. The development will include an access road, car parking hard standings and associated drainage systems.

It is noted that the development will be similar in design and usage to that of an adjacent development on the area previously known as Plot F.

4. PREVIOUS SITE INVESTIGATIONS

4.1 1991 Investigations

A preliminary investigation was carried out for the Sony factory site and its surroundings between 22 January and 14 February 1991. The following investigation was carried out both within and adjacent to the site:

4.1.1 12 light cable percussive boreholes

4.1.2 6 boreholes extended by rotary coring.

4.1.3 27 machine excavated trial pits.

Piezometers were installed in two boreholes. In-situ and laboratory tests were undertaken on selected samples.

Borehole and trial pits logs, in-situ and laboratory test results are included in the appendices.

The location of boreholes and trial pits are shown in Figure 5.

4.2 2001 Investigations

A desk study report was produced by Ove Arup and Partners Ltd in November 2001. Existing historical data was used as part of a feasibility assessment for The Welsh Development Agency, who proposed the development of Pencoed Technology Park, encompassing Felindre Meadows.

4.3 2005 Investigations

A factual report on ground investigations was carried out by Soil Mechanics Ltd in November 2005, on behalf of Ove Arup and Partners.

The investigation was carried out as part of the wider technology park scheme, however a number of trial pits, in-situ testing and boreholes were carried out within Plot E and are presented in Appendix C.

5. GROUND CONDITIONS

5.1 Stratigraphy

The wider ground conditions encountered during the 2001 investigation may be summarised as follows:

Stratum	Thickness (m)
Topsoil	0.15-0.50
Transition Zone	Absent to 0.80
Alluvium	Absent to 2.00
Glacial Deposits	8.20 to over 17.70
Triassic	Not proved.
Carboniferous	Not proved.

5.2 Groundwater

Groundwater was generally encountered in the trial pits as slight and moderate seepages, between 2.3 and 3.6m below ground level.

Water level readings taken during the borehole drilling, did not encounter significant ground water inflows above 2.5m BGL.

5.3Topsoil and Transition Zone

The thickness of topsoil encountered was generally around 120mm, passing into a transition zone of up to 600mm thickness. This transition zone was a loose brown sandy, clayey silt with occasional fine to medium gravel and roots.

5.4 Alluvium

Alluvium was encountered in eleven trial pits and its extent corresponds to that shown on the published geology map. The maximum thickness encountered was 0.6m thick. The alluvium generally comprised loose to medium dense, light grey, orange brown and buff, slightly to very clayey, silty sand.

5.5 Glacial Deposits

5.5.1 General

Glacial deposits were present beneath the whole site, underlying the topsoil, transition zone and alluvium. They varied in thickness from 8.2m to over 17.7m. The glacial deposits were predominantly granular beneath most of the site with thin bands of cohesive material.

The cohesive deposits are interpreted to be boulder clay, deposited directly by glacial action. However, the granular deposits were probably of fluvioglacial origin, i.e. laid down by rivers flowing away from or marginal to the glacier.

5.5.2 Granular Glacial Deposits

The granular glacial deposits were predominantly a medium dense becoming dense, brown, very sandy fine to coarse sub-rounded to rounded gravel with some cobbles and occasional broken boulders.

5.5.3 Cohesive Glacial Deposits

The cohesive deposits were predominantly a firm to stiff, becoming very stiff, brown, maroon and yellow silty clay with some fine to coarse gravel. In BI-l's 3, 5, 7, 8 and 11, bands of soft yellow brown very silty clay were observed. These bands were between 1.1 and 3.5m thick and were found at depths of between 6.8 and 12m below ground level.

5.6 Bedrock Geology

5.6.1 Introduction

The bedrock was found at depths of between 9.1 and 14.4m across the site. However, the bedrock was not encountered in the extreme northern area, where at least 15 to 20m of drift cover was present.

5.6.2 Triassic Strata

Triassic rocks were encountered in five rotary cored boreholes, but probably underlie most of the site. These rocks were also encountered in previous boreholes along the motorway. In BH's 6, 11 and 13 Triassic Conglomerates were encountered whilst in BH's 3 and 5 Triassic Sandstones were found.

The conglomerate was a strong, in places moderately strong, thinly bedded medium grey and red-brown conglomerate, consisting of Carboniferous Limestones in a matrix of red-brown silty mudstones, generally clast supported. This stratum was formed in shoreline conditions by erosion of the adjacent Carboniferous Limestone and redeposition of the resultant cobbles in a marly matrix.

6. PRELIMINARY GEOTECHNICAL ADVICE

6.1 General

The preliminary site investigation was carried out some ten years ago.

6.2 Potential for Ground Surface Instability

There is some evidence from the desk study and site investigation that rising groundwater due to sub-artesian conditions is present at some locations near the centre of the site, however evidence of this was not encountered during trial excavations within the boundaries of Plot E development area.

Earthworks

Most excavations for formations, foundations and services will be in alluvium and glacial deposits and will be easily carried out using conventional earth moving equipment.

Groundwater was generally encountered between 3.0m and 4.5m below ground level and excavation in these areas may encounter some light seepages, depending on design depths.

Cut and fill earthworks to create the building platform has been completed. Existing topsoil should be removed and any obvious loose or soft areas excavated and replaced with suitable material, placed and compacted in accordance with an appropriate earthworks specification. Areas of fill should be constructed using suitable material placed and compacted in accordance with an approved earthworks specification.

Site-won excavated material from glacial sands and gravels generally will be suitable as fill for engineering purposes. Consolidation settlement beneath areas of fill is likely to be small and should be complete soon after the fill has been placed. In cut areas, the exposed formation should be proof rolled and any soft areas replaced with well-compacted granular material, typically to 300mm depth.

6.4 Foundations and Floor Slabs

Conventional pad and strip foundations are recommended for structures, taken into the glacial deposits of at least firm to stiff/medium dense consistency. Allowable bearing pressures will be typically in the range of 190kN/m2 to 250kN/m2

Although slab loads are not known, floor slabs will typically be ground bearing.

6.5 Car Parks, Access Roads and Hard Standings

In-situ California Bearing Ratio (CBR) tests were carried out along the new Felindre Meadows access road. Test results ranged from values of 4% to 7% in the alluvial and transition zone material close to the surface. It can be assumed that a CBR of 6% or better can be achieved for the suitable recompacted, site-won or imported fill.

In areas of access roads and car parks, a value of 5% should be provisionally assumed for formations in glacial deposits, although this may fall to 2% in wet weather where cohesive deposits are present at formation.

6.6 Protection of Buried Concrete

Sulphate content test results in the glacial deposits and groundwater indicated that buried concrete shall conform, as a minimum, to Class I of BRE Digest 363.

CONTENTS

1. INTRODUCTION

The Welsh Development Agency are considering developing a site to the east and south of the existing Sony Factory at Pencoed near Bridgend. Arup have been commissioned to carry out a desk study of the site.

The majority of the site was previously examined in 1991 as part of the Sony Development. A preliminary site investigation was carried out at this stage by Integral Geotechnique Ltd. under the supervision of Ove Arup and Partners.

This desk study report presents the results of a historical and geological desk study and summarises the results of the previous site investigation. It gives preliminary geotechnical comments and recommends a minor additional investigation in the north-east corner at preliminary stage. Further detailed investigation will be required across the whole site once full proposals are known.

2. THE SITE

2.1 Location and Description

The site is located north-east of Junction 35 of the M4 motorway and east of the existing Sony factory to the east of Penrhos, Mid Glamorgan. The National Grid Reference of the centre of the site is SS970809, see Figure 1. It is bounded to the south by the M4, to the west by the A473 and the existing Sony Factory and to the north and east by Pelindre Road, see Figure 2.

The site covers approximately 65ha. The topography is relatively flat, sloping very gently towards the south-west. Shallow undulations occur locally across the site. The ground to the south of the motorway rises steeply onto a hillside sloping at about 1 on 6. A local shallow depression is present in the south east and a wet vegetated area is also located nearby, see Figure 2

The Ewenny Fach River flows through the site, entering in the north east corner and leaving in the south-west. Small ponds formed as part of the Sony Factory is situated in the south-west.

The majority of the land is currently undeveloped fields which are in agricultural use. A car park, access road and small building associated with the Sony Factory is situated along the western boundary. A farm called Pantruthin-Fawr is situates adjacent to the M4 motorway in the south-west, see Figure 2. A small road runs from this farm to Pelindre Road in the east. An earth bund is present between the factory and cemetery in the north-west.

2.2 Archaeological History

An initial archaeological search has shown that the general region is historically rich. In particular, the existing ground is very hummocky in a small area in the north west, the Ordnance Survey Map indicates an ancient "Moat" site.

An assessment of the potential for significant archaeological remains within the site, undertaken in 1991, is presented in Appendix A.

2.3 Recent History

The recent history of the site has been studied on old Ordnance Survey Maps dating from 1877 and on aerial photographs since 1946.

In 1877, the land was generally undeveloped, consisting of open fields; see Figure 3a. Pelindre, Bryn-Cwtyn and Pantruthin Fawr Farms already existed and the access tracks had also been constructed. A system of footpaths and footbridges traversed the site. In the north-east corner, the district boundary followed the centre of a linear hollow feature and the Ewenny Fach River was unusually straight in this area. This suggests that the river had been straightened prior to 1877 and the hollow is probably the old river course. An artificially cut off meander can also be seen on the 1877 plan to the east of Bryn-Cwtyn on the Ewenny River. No further development had occurred on the site by 1920, see Figure 3b, although the abandoned meander course was shown indistinctly and presumably was virtually obliterated.

By 1946, two very small buildings had been constructed near field boundaries on the eastern side of the site. These were probably small barns or sheds for agricultural use.

In 1954, earthworks were being carried out in the north of the site, marking the construction of Penrhos Cemetery.

By 1979, the new M4 motorway had been constructed in the south, the A473 has been built in the west; Pelindre Road had been constructed in the north and realigned in the east. The two

small barns/sheds had been dismantled. Bryn-Owtyn Farm had been demolished by this time but a small additional building has been constructed in the south east, see Figure 2.

All aerial photographs show depressions and surface features on the site, see Figure 2. A circular depression (A) is present in the north-east, marked on all air photographs since 1946. A local farmer indicated that this depression appeared suddenly, sometime in the late 1940s, as a "blister" on the ground surface. On piercing the "blister" with pickaxes, a release of groundwater occurred and the ground subsided to form the present depression feature. It is probable that the depression formed as a result of ground loss due to washing out of fines in the outburst of water. Two other small circular depressions were also observed on some aerial photographs but were absent on others; B and C, on Figure 2. The farmer has stated that the most recent depressions (B) was the result of a similar mechanism as discussed above, but on a smaller scale. This depression was quickly infilled, which explains its absence on later photographs. No details have been discovered about the nature of depression C.

Two small channel features are visible on all aerial photographs, south east of depression A and trending parallel with the River Ewenny; see Figure 2. These were dry and may indicate the positions of former issues. However, there are no indications of former springs in this area on the old ordnance survey maps.

In 1991/1992 the existing Sony factory was developed across agricultural land to the west. The scheme included the construction of a surface car park in the western area of the site together with a smaller structure, see Figure 2. As part of this development, ponds were formed to the south and south-west of the factory, and an access road, service station, hotel and fast food restaurant was built in the south-west corner of the site.

2.4 Published Geology

The geology of the site has been studies on British Geological Survey maps, Sheet SS 98 SE (1970 and 1984).

The 1970 map shows the site to be underlain by the littoral facies of the Mercia Mudstone. This unit was formerly known as the "Dolomite Conglomerate" and is a Triassic shoreline deposit. Carboniferous Limestone is shown outcropping on the hillside approximately 30m south of the site and these beds dip towards the north. The map shows the Undivided Millstone Grit Series outcropping some 100m north of the site and the base of the Coal Measures are conjectured to outcrop some 500m to the north.

However, the revised 1984 map shows that the majority of the site is underlain by Oxwich Head Limestone of the Carboniferous Limestone sequence with Undivided Namurian (Millstone Grit) present in the north, see Figure 4. The conjectural line of a fault is located in the north west, trending north-east to south-west.

Superficial deposits overlie the bedrock across all of the site. Alluvium is shown overlying the south-western and central areas, with river terrace deposits in the north-west and glacial boulder clay in the south-east. The boulder clay is probably present beneath the alluvium and river terrace deposits across the site. Head Deposits are shown in the extreme south, along the flanks of the Carboniferous Limestone hills, see Figure 4.

2.5 Natural Cavities and Abandoned Mining

During the late 1980's, the Department of Environment commissioned geographical reviews on the influence of natural cavities and abandoned mineworkings on ground surface stability (carried out by Applied Geology and Arup Geotechnics respectively). The databases from these studies have been consulted.

Records of six natural cavities have been found within 2km of the site, although none are within the site boundary itself. The cavities were mostly "sink holes", recorded in areas where Carboniferous Limestone directly underlies the glacial sands. However, a sink hole in the Triassic Conglomerate was recorded at an opencast coal site east of Llanfaethlu.

The abandoned mineworkings database contains no records of workings beneath the site itself. The nearest recorded mine entrance was a small lead mine near to Ruthen, about 460m south of the site and within the Carboniferous Limestone. Furthermore, the geological environment of the site is such that the likelihood of unrecorded mineworkings is considered negligible.

3. PROPOSED DEVELOPMENT

At the time of writing this report, the type and layout of the development is not known.

It is thought that industrial units are planned together with access roads, car parks and hardstandings. Depending on detailed proposals, the Ewenny Fach River could require diversion and culverts will be needed where access roads cross the river.

Earthworks will be necessary to create level building platforms. At this stage, these are not expected to exceed 2m of cut or fill and generally will be less.

4. PREVIOUS SITE INVESTIGATIONS

4.1 1971 Investigations

A site investigation was carried out along the southern and western boundaries of the site, drilled as part of the M4/A48 construction in the 1970s (see Reference 3).

The initial investigation was carried out by GKN Foundation Limited, five boreholes were located in the immediate vicinity of the site. Their locations are shown on Figure 5. Borehole logs and laboratory test results are presented in Appendix B and C.

During the construction of the M4, it is reported that ground surface subsidence occurred in the south and west and a further investigation was carried out to search for solution cavities within the Mercia Mudstone and Carboniferous Limestone bedrock. At least one solution cavity was encountered in a borehole in this investigation.

4.2 1991 Investigation

A preliminary investigation was carried out for the Sony factory site and its surroundings between 22 January and 04 February 1991. The following investigation was carried out on the site currently being considered.

- 12 light cable percussive boreholes
- 6 boreholes extended by rotary coring
- 27 mechine excavated trial pits

Piezometers were installed in two boreholes. In-situ and laboratory tests were undertaken on selected samples.

Borehole and trial pits logs, in-situ and laboratory test results are included in the Appendix B and C.

The locations of boreholes and trial pits are shown in Figure 5.

5. GROUND CONDITIONS

5.1 Stratigraphy

The ground conditions encountered during the investigation are illustrated on the cross-sections in Figures 6a and 6b. The stratigraphy may be summarised as follows:

Stratum	Thickness (m)
Topsoil	0.15-0.50
Transition Zone	Absent to 0.80
Alluvium	Absent to 2.00
Glacial Deposits	8.20 to over 17.70
Triassic	Not proved
Carboniferous	Not proved

5.2 Groundwater

Groundwater was generally encountered in the trial pits as slight and moderate seepages, between 2.0 and 3.6m below ground level. Trial pits 19, 22, 35 and 36 were close to the Twenty Fach River or its tributaries, and these encountered seepages at shallower depths. TP 23, located in a low area, also encountered shallow seepages.

TP34 was excavated in a particularly wet field and was located near the depression A observed on aerial photographs and discussed in Section 2.3. Here, the groundwater ingress was very rapid from a depth of 1.0m causing large scale instability of the pit and it proved impractical to excavate below 1.5m.

Water level readings taken during the borehole drilling, together with limited piezometric levels are presented in Table 1. These levels are also shown on the sections in Figures 6a and 6b. The levels indicate that the phreatic surface varies between 31.4mAOD in the north-east and 25.5m AOD in the south-west.

During the light cable percussive boring of BH3, the water level was observed to be at 28.2mAOD. However, when the borehole was subsequently extended by rotary coring into the rock, the water level rose quickly to 30.7mAOD, indicating the sub artesian water pressure within the bedrock at this location. This is also located quite close to depression A.

5.3 Topsoil and Transition Zone

The thickness of topsoil encountered was generally around 300mm, passing into a transition zone of up to 800mm thickness. This transition zone was a loose brown sandy, clayey silt with occasional fine to medium gravel and roots.

5.4 Alluvium

Alluvium was encountered in eleven trial pits and its extent corresponds to that shown on the published geology map; see Figure 5. The maximum thickness encountered was 2.0m in TP32, but generally it was around 0.6m to 0.7m thick. The alluvium generally comprised loose to medium dense, light grey, orange brown and buff, slightly to very clayey, silty sand.

BOREHOLE NO	WATER DEPTH DURING DRILLING (m)	WATER LEVEL DURING DRILLING (mAOD)	PIEZOMETER WATER LEVEL (mAOD)	
			6.2.91	19.2.91
3	1.4	28.19		
4	3.1-3.8	26.52-27.22		
5	3.1-3.1	25.25-25.55		
6	2.2	26.71		
7	4.6-4.7	26.35-26.45	26.85	26.55
8	2.1-4.6	27.75-30.25		
9	2.8-7.3	26.83-31.30		
10	2.6-3.2	29.88-30.48		
11	1.1-1.6	30.9-31.4		
12	2.5	30.8		
13	1.1	29.91		30.71
14	2.15-2.7	27.88-28.43		
BH	0.9	30.69		

TABLE 1 GROUNDWATER OBSERVATIONS

5.5 Glacial Deposits

5.5.1 General

Glacial deposits were present beneath the whole site, underlying the topsoil, transition zone and alluvium. They varied in thickness from 8.2m to over 17.7m. The glacial deposits were predominantly granular beneath most of the site with thin bands of cohesive material. However, in the centre of the site, they were predominantly cohesive; e.g. Boreholes 3, 13 and 14.

The cohesive deposits are interpreted to be boulder clay, deposited directly by glacial action. However, the granular deposits were probably of fluvioglacial origin, i.e. laid down by rivers flowing away from or marginal to the glacier.

The sections in Figure 6a and 6b show conjecturally that the cohesive and granular deposits interdigitate, as a result of minor advances and retreats of the glaciers during deposition of the sequence. Consequently, some of the gravels probably have been overriden and reworked by glacial action.

In the extreme south west (BH5), medium dense/loose sands were encountered beneath the fluvioglacial gravels. These represent deposition in quieter conditions, possibly a temporary glacial lake.

5.5.2 Granular Glacial Deposits

The granular glacial deposits were predominantly a medium dense becoming dense , brown, very sandy fine to coarse sub-rounded to rounded gravel with some cobbles and occasional broken boulders.

5.5.3 Cohesive Glacial Deposits

The cohesive deposits were predominantly a firm to stiff, becoming very stiff, brown , maroon and yellow silty clay with some fine to coarse gravel. In BH's 2, 5, 7, 8 and 11, bands of soft yellow brown very silty clay were observed. These bands were between 1.1 and 3.5m thick and were found at depths of between 6.8 and 12m below ground level. However, the consistency of this material has probably been affected by a differential hydraulic head causing uplift to the soil at the bottom of the casing during drilling. In cases where this differential hydraulic head was prevented from occurring by maintaining a head of water in the borehole, the material was observed to have a firm consistency.

5.6 Bedrock Geology

5.6.1 Introduction

The bedrock was found at depths of between 9.1 and 14.4m across the site. However, the bedrock was not encountered in the extreme northern area, where at least 15 to 20m of drift cover was present. Triassic rocks generally underlie the site at most borehole locations, but Carboniferous rocks were present directly beneath the drift in Boreholes 9 and 14. This suggests that the upper surface of the underlying Carboniferous is irregular and the Triassic has to some extent infilled the irregularities.

5.6.2 Triassic Strata

Triassic rocks were encountered in five rotary cored boreholes, but probably underlie most of the site. These rocks were also encountered in previous boreholes along the motorway. In BH's 6, 11 and 13 Triassic Conglomerates were encountered whilst in BH's 3 and 5 Triassic Sandstones were found.

The conglomerate was a strong, in places moderately strong, thinly bedded medium grey and red brown conglomerate, consisting of Carboniferous Limestones in a matrix of red-brown silty mudstones, generally clast supported. This stratum was formed in shoreline conditions by erosion of the adjacent Carboniferous Limestone and redeposition of the resultant cobbles in a marly matrix.

Small solution cavities (5mm to 30mm diameter) were found in the cores, probably due to solutional weathering of calcite crystals originally deposited in the matrix. Also, small falls were recorded during drilling indicating clay infilled solution cavities, varying from 10mm to 1100mm high and probably following the bedding planes.

The sandstone was a moderately strong to strong, light grey thinly bedded calcareous fine sandstone, dipping at approximately 9°. Small inter-connected and unconnected solution cavities were present in the cores. In BH3 the sandstone was underlain by bands of siltstone and mudstone. This borehole also showed a 0,9m core loss and rapid penetration was recorded by the driller at about 1.6m below the bedrock surface. This could indicate a solutionally widened fissure or cavity, infilled with soft clay.

5.6.3 Carboniferous Strata

Carboniferous rocks were encountered in BH 9 and 14, where alternating mudstones and sandstones, probably of the Millstone Grit Series were found. In BH3, Carboniferous Limestone may have been encountered at the base.

The mudstones were weak, occasionally very weak, grey, very finely bedded fissured silty mudstone with the bedding nearly horizontal. This material was weathered in parts to a stiff brown silty clay. Lamellibranch fossils were observed at some locations in the cores.

The sandstones were moderately strong light yellow-grey thinly to medium bedded sandstone. The sandstones graded upwards into mudstone strata via a thin transition zone consisting of a dark grey and brown laminated siltstone and sandstone.

The Carboniferous Limestone may have been encountered at the base of BH3, proven for some 0.4m. It was a strong, medium grey re-crystallised limestone.

6. PRELIMINARY GEOTECHNICAL ADVICE

6.1 General

The preliminary site investigation was carried out some ten years ago. In the absence of details of the proposed development, particularly structure locations and details of loadings, the comments below are for guidance only, and will need to be confirmed by detailed investigation when firm development proposals are known, see Section 6.7.

6.2 Potential for Ground Surface Instability

There is some evidence from the desk study and site investigation that rising groundwater due to sub-artesian conditions is present at some locations near the centre of the site. In BH3, a high water level was encountered whilst rotary coring the rock, suggesting that a sub-artesian water pressure was present at this location. Also, the accounts of the two surface "blisters" and resulting depressions discussed in Section 2.3, one of which was located some 100m from BH3, suggests that artesian water pressures have occurred from time to time. High water pressures were not present in BH5 and 11 nearby, and hence the limits of this phenomenon are unknown. The extent will need to be confirmed by a detailed investigation and sub-artesian conditions will need to be accommodated for in the design.

Small solution features and interconnected channels have been observed in the rock cores and during drilling. There is a potential that ground loss could occur into these solution features, resulting in subsidence of the overlying ground. It is reported that ground surface subsidence occurred during the construction of the M4 motorway in the south, see Section 4.1. However, the solution cavities encountered during this investigation were generally small and in addition, some 9 to 15m of drift cover was present across the site. This indicates that the likelihood of cavities migrating to the surface is very small and the potential for ground surface instability occurring due to this process is therefore considered to be very low.

6.3 Earthworks

Most excavations for formations, foundations and services will be in alluvium and glacial deposits and will be easily carried out using conventional earth moving equipment.

Groundwater was generally encountered between 2.6m and 4.5m below ground level, although in local areas, the water level was slightly higher. Excavation in these areas may encounter some seepages, depending on design depths and locations. These may be dealt with by pumping from sumps within the excavations. However, high ground water levels were met in BH13 and TP34 and it may become difficult to dewater excavations in this area without sheet pile cut-offs and possibly a wellpoint dewatering system. Permanent drainage will probably be necessary in this area, see below.

Minor cut and fill earthworks will be required to create building platforms. In fill areas, existing topsoil should be removed and any obvious loose or soft areas excavated and replaced with suitable material, placed and compacted in accordance with an appropriate earthworks specification. The areas of fill should be constructed using suitable material placed and compacted in accordance with an approved earthworks specification.

Site won excavated material from glacial sands and gravels generally will be suitable as fill for engineering purposes. Consolidation settlement beneath areas of fill are likely to be small and should be complete soon after the fill has been placed. In cut areas, the exposed formation should be proof rolled and any soft areas replaced with well-compacted granular material, typically to 300mm depth.

A careful watch should be maintained in cut and fill areas for zones of sub-artesian groundwater conditions, where provisions for permanent drainage to relieve water pressures may be necessary. This should be confirmed by the findings of a detailed investigation, see Section 6.7

6.4 Foundations and Floor Slabs

Conventional pad and strip foundations are provisionally recommended for structures, taken into the glacial deposits of at least firm to stiff/medium dense consistency. Allowable bearing pressures will vary with depth and position on site, typically in the range of 150kN/m² to 300kN/m².

Although slab loads are not known, floor slabs are likely to be ground bearing.

Sub-artesian groundwater and the potential for ground surface instability should be accommodated for in the design where necessary.

6.5 Car Parks, Access Roads and Hardstandings

In-situ California Bearing Ratio (CBR) tests were carried out in the area of the proposed demolition of the A473. Test results ranged from values of 2% to 5% in the alluvial and transition zone material close to the surface. The location and elevation of the road is not known, however, if the road is to be built on a 1 to 2m high embankment, it can be assumed that a CBR of 6% or better can be achieved for the suitable recompacted, site-won or imported fill.

In areas of access roads and car parks, a value of 5% should be provisionally assumed for formations in glacial deposits, although this may fall to 2% in wet weather where cohesive deposits are present at formation. In-situ and recompacted CBR values in the transition zone and alluvium were low and will be susceptible to deterioration due to trafficking and wet weather. Where these materials are exposed at formation level, it is recommended that a CBR value of 1 shall be assumed at this stage.

6.6 Protection of Buried Concrete

Sulphate content test results in the glacial deposits and groundwater indicated that buried concrete shall conform, as a minimum, to Class 1 of BRE Digest 363 (see Reference 4). However, individual tests in the alluvium and weathered conglomerate gave values of 0.25% and 0.3% indicating Class 2 conditions. These values should be confirmed by further tests at detailed investigation stage.

6.7 Further Site Investigation

No site investigation has been undertaken in the north east corner of the site, since this was not part of the site area examined in 1991. It is considered likely that similar ground conditions are present in this area as observed along the River Ewenny to the south west. To confirm or otherwise this interpolation, it is recommended that 4-5 trial pits are excavated in this area at the preliminary stage.

A detailed site investigation should be carried out once development details are known including layouts and loadings. The investigation should be designed to provide sufficient information to confirm design parameters for foundations, floor slabs, car parks, roads and earthworks. In particular, however, the investigation must take account of the need to assess, in detail, the implication of the following on design:

- Sub-artesian groundwater within the bedrock, possibly resulting in surface up welling and ground surface instability, and where it is confined
- Potential for ground loss and surface subsidence into solution cavities within the underlying bedrock.

Typically, the investigation would consist of additional soft ground boreholes across building footprints, together with rotary coring and open hole boring to identify the bedrock geology and investigate solution cavities and groundwater levels. Allowance should be made for installing piezometers to measure groundwater pressures. Additional trial pitting is also recommended to investigate the near surface deposits in detail, particularly where car parks and access roads are planned.

APPENDIX A

1991 ARCHAEOLOGICAL STATEMENT

ARCHAEOLOGICAL POTENTIAL OF SONY PENCOED SITE

1.0 INTRODUCTION

The potential for significant archaeological remains within the Pencoed site has been studied from the following sources:-

- old ordnance survey plans
- published historical and archaeological accounts
- the public record of Sites and Monuments.

The latter source is part of the official Welsh archaeological archive which is continually updated by the Glamorgan - Gwent Archaeological Trust on behalf of CADW.

2.0 GENERAL HISTORY

The site has a well established farming history and was associated with the Knights of St John of Jerusalem, whose main land holdings in Glamorgan were in this area from medieval times. There are also suggestions of links with the Arthurian Legends, although there is little supportive evidence for this.

Old editions of the Ordnance survey maps show that the traditional rural topography of the site has remained unaltered, certainly from the mid nineteenth century until the present day. The land appears to have been occupied by the farmsteads of Pantruthin Fawr, Bryn Cwtyn and Pelindre (see Figure 4) and apart from the demolition of Bryn Cwtyn sometime between 1960 and 1979, very little else has changed. Also, a small cottage or farm known as Gwt is shown ruined on the 1875 OS map and has now disappeared. Field boundaries, which mainly follow minor features such as drainage lines, also have remained little changed, with few cases of field amalgamation or division over the years.

There is no indication that industrial activities such as quarrying or landfilling, have occurred which could influence the engineering works at the site. Significant opencast coal mining and the abandoned Llanharry haematite mines lie to the east, whilst on the higher ground to the south there were small mines for non-ferrous metal ores.

3.0 ARCHAEOLOGICAL SITES

The known areas of archaeological interest in the vicinity of the site are shown on Figure 1. These are as follows:-

Heol Porth Mawr
Pelindre
Llanhilid (Moated Mound and Church of St Illid and St Curig)
Gadlys
Ffynnon Cere
Un named "Moat" Site.

Heol Porth Mawr is an ancient routeway on the northern site boundary, along which many of the archaeological sites are clustered, e.g. the old corn mill site of Pelindre.

Llanhilid is well to the east of the site. It was probably a small medieval hamlet and the moated church site may be the remains of a deserted medieval village.

The Gadlys enclosure is described as a Roman Marching Camp on old OS plans. However, published historical accounts suggest there is no evidence for this other than local nineteenth century speculation and that it is more likely to be a domestic enclosure of medieval date.

Ffynnon Geri is a natural spring. It was probably an important water supply for Llanhilid in medieval times, hence it is named.

The only visible archaeological feature on the site itself is the un-named "moated" enclosure at the north-eastern corner, see Figure 1. This has been recognised relatively recently and is not shown on early maps. Little is known of its origin; it is a complex of ditches and banks and could be a medieval or post-medieval manor house, or it could be associated with farming at Gat. At the moment it should be regarded as a prime archaeological site. Hence, if any developments were to affect it, CADW would consider scheduling it so that its future survival would be assured.

4.0 POTENTIAL FOR ARCHAEOLOGICAL DISCOVERIES

The general lack of recognisable archaeological features on the site itself, and the paucity of recorded artefact discoveries, suggests that the site is unlikely to yield major archaeological discoveries. However, there has been little field work by archaeological groups based in Cardiff and Swansea in this area and the many medieval sites in the vicinity clearly suggest that further archaeological consideration is required, as part of the development process.

5.0 RECOMMENDATION

The area of archeological interest is remote from the Phase 1 works. The Glamorgan - Gwent Archeological Trust should be informed of the developent proposals and given an opportunity to investigate the area around the un-named "moat site", well ahead of any development in this area.

DESCRIPTION OF STRATA

Upstand level (Approx) = 20.91m AOD

See record of hole for description of strata encountered

Strong, in places moderately strong becoming bedded medium grey and red-brown fossiliferous conglomerate consisting of sub-rounded gravel and cobble of sandstone, limestone in a matrix of red-brown silty mudstone, generally clast supported.
(PERMIAN CONGLOMERATE).
Abundant small 5mm to 30mm Ø solution cavities in core, derived from solutioning of calcareous crystals.
Drilling records repeated small drops during drilling indicating solution cavities.

BOREHOLE 14R

TRIAL PIT 11 — Approx Ground Level = 28.8m AOD

Depth (m)	Strata
0.0 - 0.5	Loose brown very clayey SILT with many roots. (TOPSOIL)
0.5 - 1.6	Medium dense brown, grey and orange brown slightly clayey silty SAND with some fine to medium sub-rounded to rounded gravel of sandstone. (ALLUVIUM)
1.6 - 2.8	Dense brown SAND and fine to coarse sub-rounded GRAVEL with some cobbles and occasional broken boulders of grey sandstone. Becoming damp at 2.4m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 2.4m
2. Slight to moderate groundwater ingress at 2.6m.
3. Bulk sample taken at 0.8m.

TRIAL PIT 12

Approx Ground Level = 27.7m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly clayey SILT with some roots (TOPSOIL)
0.2 - 0.9	Medium dense orange brown and buff silty SAND, slightly clayey in places, with some medium and coarse sub-rounded gravel and occasional fine gravel of grey sandstone. (ALLUVIUM)
0.9 - 3.0	Medium dense to dense reddish brown very sandy fine to coarse sub-rounded to rounded GRAVEL some cobbles and occasional broken boulders mainly grey with occasional black iron-rich sandstone. Becoming damp at 2.0m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit stable.
2. Slight groundwater ingress at base of pit.
3. CBR test carried out at 0.6m.
4. Bulk sample taken at 0.6m.

TRIAL PIT 13 — Approx Ground Level = 28.6m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly clayey SILT with many roots. (TOPSOIL)
0.2 - 0.4	Loose brown slightly clayey SILT with medium and coarse sub-angular to sub-rounded gravel of sandstone. (TRANSITION ZONE)
0.4 - 0.5	Soft to firm light grey mottled orange brown sandy very clayey SILT. Very sandy in places. (ALLUVIUM)
0.5 - 1.3	Medium dense to dense orange brown and grey silty very sandy fine to coarse sub-rounded to rounded GRAVEL with occasional cobbles of sandstone. (GLACIAL SAND AND GRAVEL)
1.3 - 2.7	Dense orange brown SAND and fine to coarse sub-rounded to rounded GRAVEL with some cobbles and occasional broken boulders all of grey sandstone. Becoming damp at 1.9m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 1.0m.
2. Moderate groundwater ingress at 2.2m. Rose to 2.4m in 5 minutes.
3. Bulk sample taken at 1.3m.

TRIAL PIT 14 — Approx Ground Level = 30.2m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly clayey sandy SILT with many roots (TOPSOIL)
0.2 - 1.0	Loose to medium dense orange brown clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone and occasional rootlets. (TRANSITION ZONE)
1.0 - 3.2	Medium dense to dense brown very sandy fine to coarse sub-rounded to rounded GRAVEL with occasional cobbles all of grey sandstone. Becoming dense at 1.5m. With occasional platey sub rounded broken boulders below 2.3m. Becoming damp at 2.5m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit stable.
2. Slight to moderate groundwater ingress at 3.0m.
3. Bulk sample taken at 2.8m.

TRIAL PIT 15 — Approx Ground Level = 29.0m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown clayey SILT with many roots. (TOPSOIL)
0.2 - 0.7	Loose to medium dense orange brown and buff very silty SAND with occasional medium sub-rounded gravel of grey sandstone. (ALLUVIUM)
0.7 - 2.8	Medium dense to dense orange brown very sandy fine to coarse sub-rounded GRAVEL. Becoming reddish brown and silty at 1.1m. Becoming damp at 1.9m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 2.2m.
2. Slight to moderate, becoming strong groundwater ingress at 2.2m.
3. Pit dug some 10m from stream.
4. CBR test carried out at 0.4m.
5. Bulk sample taken at 0.4m.

TRIAL PIT 16 — Approx Ground Level - 28.2m AOD

Depth (m)	Strata
0.0 - 0.3	Loose dark brown slightly clayey SILT with many roots. (TOPSOIL)
0.3 - 0.9	Medium dense orange brown silty SAND with some fine to coarse sub-rounded gravel of sandstone. (TRANSITION ZONE)
0.9 - 2.4	Medium dense brown sandy fine to coarse sub-rounded to rounded GRAVEL with some cobbles and occasional broken boulders all of grey sandstone. Becoming medium dense to dense at 1.8m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 2.0m.
2. Moderate groundwater ingress at 2.0m.
3. Bulk sample taken at 1.5m.
4. Occasional traces of black coal at about 1.3m.

TRIAL PIT 17 Approx Ground Level = 19.8m AOD

Depth (m)	Strata
0.0 - 0.3	Loose brown slightly clayey SILT with many roots. (TOPSOIL)
0.3 - 0.5	Loose to medium dense orange brown silty SAND with some fine to coarse sub rounded gravel of sandstone. (TRANSITION ZONE)
0.5 - 3.0	Medium dense brown very sandy fine to coarse sub-rounded GRAVEL with occasional cobbles. Becoming medium dense to dense below 1.0m with occasional sub-rounded large broken boulders. Becoming damp at 2.4m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit slightly unstable to 0.5m and collapsing below 2.8m.
2. Slight to moderate groundwater ingress at 2.8m.
3. Bulk sample taken at 2.4m.

TRIAL PIT 16 — Approx Ground Level = 31.1m AOD

Depth (m).	Strata
0.0 - 0.3	Loose dark brown sandy SILT with many roots. (TOPSOIL)
0.3 - 0.5	Loose orange brown clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone. (TRANSITION ZONE)
0.5 - 1.3	Loose to medium dense orange brown and grey very sandy fine to coarse sub-rounded GRAVEL with occasional sub-rounded cobbles. (GLACIAL SAND AND GRAVEL)
1.3 - 3.5	Medium dense brown very sandy fine to coarse sub-rounded GRAVEL with some sub rounded cobbles and occasional broken boulders of grey, and occasionally red, sandstone. Occasional traces of soft maroon silty clay around cobbles at 2.3m. Occasional light brown sandstone boulders at 2.8m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit slightly unstable.
2. Slight water ingress at 3.4m.
3. Bulk sample taken at 1.5m.

TRIAL PIT 10 — Approx Ground Level = 31.1m AOD

Depth (m)	Strata
0.0 - 0.3	Loose dark brown sandy SILT with many roots. (TOPSOIL)
0.3 - 0.9	Loose to medium dense orange brown slightly clayey SILT with occasional medium and coarse sub-angular gravel and occasional rootlets. (TRANSITION ZONE)
0.9 - 1.2	Medium dense brown silty SAND and fine to coarse sub-rounded GRAVEL. (GLACIAL SAND AND GRAVEL)
1.2 - 2.6	Medium dense brown very sandy fine to coarse sub rounded to rounded GRAVEL with some cobbles and occasional broken boulders all of grey sandstone. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 1.4m.
2. Moderate groundwater ingress at 1.4m.
3. Pit dug some 15m from a ditch with water flowing.

TRIAL PIT 2C

Approx Ground Level = 32.9m AOD

Depth (m)	Strata
0.0 - 0.2	Loose orange brown slightly clayey SILT with many roots. (TOPSOIL)
0.2 - 0.8	Medium dense orange very clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone. (TRANSITION ZONE)
0.8 - 1.2	Medium dense brown silty very clayey SAND with occasional medium and coarse sub-rounded gravel. (GLACIAL SAND AND GRAVEL)
1.2 - 2.3	Medium dense to dense brown slightly clayey silty very sandy fine to coarse sub-rounded GRAVEL with some sub-rounded cobbles of grey sandstone and traces of soft maroon very sandy clay. (GLACIAL SAND AND GRAVEL)
2.3 - 3.6	Firm to stiff maroon silty CLAY with some fine to coarse sub rounded to rounded gravel of grey, light brown and maroon sandstone. Becoming firm, damp and very sandy at 2.8m. (GLACIAL CLAY)

Notes

1. Sides of pit stable.
2. No groundwater encountered.

TRIAL PIT 21 Approx Ground Level ... 32.1m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly clayey SILT with many roots (TOPSOIL)
0.2 - 0.8	Loose to medium dense orange brown slightly clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone (TRANSITION ZONE)
0.8 - 2.8	Medium dense to dense orange brown and grey very sandy fine to coarse sub-rounded to rounded GRAVEL with occasional cobbles of grey sandstone. Becoming damp at 2.1m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 2.1m

2. Moderate groundwater ingress at 2.7m.

TRIAL PIT 22 — Approx Ground Level = 30.7m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly clayey SILT with many roots. (TOPSOIL)
0.2 - 0.7	Loose to medium dense orange brown slightly clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone. (TRANSITION ZONE)
0.7 - 1.5	Medium dense orange brown and grey very sandy fine to coarse sub-rounded to rounded GRAVEL with occasional cobbles of grey sandstone. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 0.7m.
2. Moderate to strong groundwater ingress at 1.1m.
3. Pit dug some 7m from a ditch with flowing water.
4. Bulk samples taken at 1.3m.

TRIAL PIT 23 Approx Ground Level = 32.4m AOD

Depth (m)	Strata
0.0 0.2	Loose dark brown slightly clayey SILT with many roots. (TOPSOIL)
0.2 - 1.0	Medium dense orange brown slightly sandy clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone. (TRANSITION ZONE)
1.0 - 2.0	Medium dense to dense brown very sandy fine to coarse sub rounded to rounded GRAVEL with some cobbles and occasional broken boulders of grey sandstone. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 0.4m.
2. Moderate to strong groundwater ingress at 1.5m.
3. Bulk sample taken at 1.6m.

TRIAL PIT 24

Approx Ground Level = 34.8m AOD

Depth (m)	Strata
0.0 - 0.3	Loose brown slightly clayey SILT with many roots. (TOPSOIL)
0.3 - 0.9	Medium dense orange brown sandy, very clayey in places, SILT with occasional fine to coarse sub-rounded gravel of grey sandstone. (TRANSITION ZONE)
0.9 - 3.0	Medium dense to dense orange brown SAND and grey fine to coarse sub rounded to rounded GRAVEL of sandstone. Becoming very sandy gravel at 1.5m. Becoming damp at 2.5m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit slightly unstable below 2.5m.
2. Slight to moderate groundwater ingress at 2.7m.
3. Bulk sample taken at 0.8m.

TRIAL PIT 25 — Approx Ground Level = 35.4m AOD

Depth (m)	Strata
0.0 - 0.3	Loose brown slightly clayey SILT with many roots. (TOPSOIL)
0.3 - 0.8	Medium dense orange brown slightly sandy clayey SILT with occasional medium and coarse sub rounded of grey sandstone. (TRANSITION ZONE)
0.8 - 3.6	Medium dense to dense brown very sandy fine to coarse sub rounded to rounded GRAVEL with some cobbles of grey sandstone. Occasional broken boulders below 1.7m, becoming damp at 1.8m. (GLACIAL SAND AND GRAVELS)

Notes

1. Sides of pit stable.
2. Slight groundwater ingress at 3.5m.
3. Bulk sample taken at 1.2m.

TRIAL PIT 26 — Approx Ground Level = 34.6m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown clayey SILT with many roots. (TOPSOIL)
0.2 - 0.7	Loose to medium dense reddish brown slightly clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone. (TRANSITION ZONE)
0.7 - 1.4	Medium dense brown silty SAND with some fine to coarse sub-rounded gravel of sandstone. (GLACIAL SAND AND GRAVEL)
1.4 - 3.2	Medium dense to dense brown very sandy fine to coarse sub-rounded to rounded GRAVEL with occasional boulders of grey sandstone. Occasional large broken boulders below 2.8m. Becoming damp at 1.7m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 2.2m.
2. Slight to moderate groundwater ingress at 2.8m.
3. Bulk sample taken at 1.7m.

TRIAL PIT 27 — Approx Ground Level = 33.3m AOD

Depth (m)	Strata
0.0 - 0.4	Loose dark brown clayey SILT with many roots. (TOPSOIL)
0.4 - 0.9	Medium dense light brown slightly clayey silty SAND with occasional medium and coarse sub-rounded gravel of grey sandstone. (TRANSITION ZONE)
0.9 - 1.4	Medium dense reddish brown slightly clayey SAND with some fine and medium sub-rounded to rounded gravel of sandstone. (GLACIAL SAND AND GRAVEL)
1.4 - 2.8	Medium dense to dense brown very sandy fine to coarse sub-rounded to rounded GRAVEL with some cobbles and occasional boulders of grey sandstone. Becoming damp at 1.6m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 1.8m.
2. Moderate groundwater ingress at 2.5m.

TRIAL PIT 28

Approx Ground Level = 32.1m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly sandy SILT with many roots. (TOPSOIL)
0.2 - 0.5	Loose orange brown slightly clayey SILT with occasional medium and coarse sub-rounded gravel. (TRANSITION ZONE)
0.5 - 1.0	Medium dense light grey with orange mottling slightly clayey, very clayey in places, silty SAND. (ALLUVIUM)
1.0 - 1.9	Dense reddish brown silty SAND with much grey, dark red and brown fine and medium gravel of sandstone. (GLACIAL SAND AND GRAVEL)
1.9 - 3.0	Medium dense to dense brown very sandy fine to coarse sub-rounded to rounded GRAVEL with some cobbles and occasional broken boulders all of grey sandstone. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 2.1m.
2. Slight to moderate groundwater ingress at 2.0m.
3. Bulk sample taken at 2.8m.

TRIAL PIT 29 — Approx Ground Level = 34.4m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly sandy SILT with occasional fine and medium sub-rounded gravel and many roots. (TOPSOIL)
0.2 - 1.0	Loose to medium dense orange brown slightly sandy very clayey SILT with occasional medium and coarse sub-rounded gravel and occasional traces of black coal fragments. (GLACIAL SAND AND GRAVEL : NORTH SIDE OF PIT ONLY)
0.2/1.0 - 2.1	Medium dense orange brown silty SAND with some fine to coarse sub-rounded gravel of grey sandstone. (GLACIAL SAND AND GRAVEL)
2.1 - 3.9	Medium dense to dense brown SAND and fine to coarse sub-rounded to rounded GRAVEL with some cobbles and occasional boulders all of grey sandstone. Becoming damp at 3.1m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit slightly unstable between 0.4m and 1.0m.
2. Slight groundwater ingress at base of pit.
3. Bulk sample taken at 1.6m.

TRIAL PIT 30

Approx Ground Level = 31.6m AOD

Depth (m)	Strata
0.0 - 0.4	Loose dark brown clayey SILT with many roots and occasional medium and coarse gravel below 0.2m. (TOPSOIL)
0.4 - 0.8	Loose orange brown slightly sandy clayey SILT with occasional medium and coarse sub-rounded gravel. (ALLUVIUM)
0.8 - 1.5	Medium dense to dense reddish brown slightly clayey silty very sandy fine to coarse sub-rounded to rounded GRAVEL with occasional cobbles of grey sandstone. (GLACIAL SAND AND GRAVEL)
1.5 - 3.3	Firm to stiff maroon silty CLAY with some fine to coarse sub-rounded gravel mainly of grey sandstone, with occasional light brown sandstone. (GLACIAL CLAY)

Notes:

1. Sides of pit slightly unstable to 1.5m.
2. Slight groundwater ingress at 1.4m and 2.2m.
3. Slight to moderate groundwater ingress at 3.2m.
4. Bulk sample at 1.7m.
5. Pit was dug in a very wet field with small patches of standing water.

TRIAL PIT 31

Approx Ground Level = 31.0m AOD

Depth (m)	Strata
0.0 - 0.4	Loose dark brown very clayey SILT with many roots. (TOPSOIL)
0.4 - 1.4	Medium dense light grey with orange brown mottling silty SAND with occasional pockets of clayey sand. (ALLUVIUM)
1.4 - 1.9	Medium dense brown very sandy fine to course sub-rounded GRAVEL of grey sandstone. (GLACIAL SAND AND GRAVEL)
1.9 - 3.2	Stiff maroon silty CLAY with occasional medium and coarse sub-rounded gravel and cobbles of grey sandstone. Occasional pockets of soft to firm reddish brown silty clay and light grey sand. (GLACIAL CLAY)

Notes

1. Sides of pit stable.
2. No groundwater ingress observed.

TRIAL PIT 32 — Approx Ground Level = 30.3m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly sandy SILT with many roots. (TOPSOIL)
0.2 - 0.7	Loose to medium dense brown slightly sandy SILT with occasional roots. (TRANSITION ZONE)
0.7 - 0.9	Loose to medium dense light grey slightly silty SAND. (ALLUVIUM : EAST SIDE OF PIT ONLY)
0.7/0.9 - 1.1	Medium dense orange brown and buff very clayey SILT with much fine gravel of black sub-angular to sub-rounded sandstone. (ALLUVIUM)
1.1 - 3.3	Medium dense to dense damp dark brown very sandy fine to coarse sub-rounded GRAVEL of grey and black iron-rich sandstone, and some cobbles of grey sandstone. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit slightly unstable below 2.3m.
2. Slight groundwater ingress at 2.0m.
3. CBR test carried out at 0.6m.
4. Bulk sample taken at 0.6m.

TRIAL PIT 33 — Approx Ground Level = 32.2m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly clayey sandy SILT with many roots. (TOPSOIL)
0.2 - 0.8	Loose to medium dense brown silty SAND and fine to coarse GRAVEL. (GLACIAL SAND AND GRAVEL)
0.8 - 2.8	Medium dense orange brown and grey very sandy fine to coarse sub-rounded to rounded GRAVEL with occasional cobbles and traces of grey sand lenses. Becoming medium dense to dense with some cobbles and occasional broken boulders at 1.5m. Becoming damp at 2.2m. (GLACIAL SAND AND GRAVEL)
2.8 - 3.4	Stiff maroon silty CLAY with some fine to medium sub-rounded to rounded gravel of grey and light brown sandstone. (GLACIAL CLAY)

Notes

1. Sides of pit slightly unstable at 0.8m.
2. Slight groundwater ingress at 2.4m.
3. Bulk samples taken at 0.8m and 3.0m.

TRIAL PIT 34 — Approx Ground Level - 34.2m AOD

Depth (m)	Strata
0.0 - 0.4	Loose dark brown very clayey SILT with some roots. (TOPSOIL)
0.4 - 0.8	Loose dark grey very clayey SILT with much decaying grass and roots. (BURIED TOPSOIL)
0.8 1.5	Medium dense orange brown slightly clayey sand SILT with some fine to coarse sub rounded gravel. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 1.2m.
2. Very strong ingress of groundwater at 1.0m from north side of pit - pit abandoned.
3. 100mm diam. clay pipe encountered at 1.0m, slight water seepage from it.
4. This pit was dug in the vicinity of a circular feature observed on aerial photographs.

TRIAL PIT 35 — Approx Ground level = 32.5m AOD

Depth (m)	Strata
0.0 - 0.3	Loose dark brown very sandy SILT with many roots. (TOPSOIL)
0.3 - 0.8	Medium dense damp light brown and light grey silty SAND, becoming slightly clayey with depth. (ALLUVIUM)
0.8 - 1.2	Medium dense reddish brown and grey slightly clayey silty SAND with occasional medium and coarse sub-rounded gravel of grey sandstone (GLACIAL SAND AND GRAVEL)
1.2 - 2.3	Medium dense to dense reddish brown silty very sandy fine to coarse sub-rounded GRAVEL with occasional cobbles and boulders. Becoming damp below 1.4m. (GLACIAL SAND AND GRAVEL)
2.3 - 3.3	Firm to stiff maroon silty CLAY with some sub-rounded to rounded fine to coarse gravel of grey, buff and black sandstone. (GLACIAL CLAY)

Notes

1. Sides of pit slightly unstable below 1.3m.
2. Slight groundwater ingress at 1.4m.

TRIAL PIT 06

Approx Ground Level = 32.2m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly clayey SILT with some roots. (TOPSOIL)
0.2 - 0.8	Loose to medium dense light grey, buff and orange brown slightly clayey silty SAND with occasional medium and coarse sub-rounded gravel. (ALLUVIUM)
0.8 - 2.7	Medium dense to dense brown very sandy fine to coarse sub-rounded to rounded GRAVEL with occasional cobbles of grey sandstone. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 1.7m.
2. Slight groundwater ingress at 1.7m.
3. Bulk sample taken at 1.7m.

TRIAL PIT 37 — Approx Ground Level - 32.5m AOD

Depth (m)	Strata
0.0 - 0.4	Loose dark brown slightly sandy SILT with some roots. (TOPSOIL)
0.4 - 0.7	Loose to medium dense brown sandy very clayey SILT with occasional medium to coarse sub-rounded gravel. (TRANSITION ZONE)
0.7 - 1.6	Loose to medium dense light grey and orange brown silty SAND, very clayey in places, with occasional medium and coarse sub-rounded gravel of sandstone. (ALLUVIUM)
1.6 - 3.0	Medium dense to dense brown very sandy fine to coarse sub rounded to rounded GRAVEL with occasional cobbles of grey sandstone. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 1.6m.
2. Slight to moderate groundwater ingress at 2.8m.
3. Bulk sample taken at 1.4m.

TRIAL PIT 35

Approx Ground Level = 33.3m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly sandy SILT with many roots and a trace of fine to medium gravel. (TOPSOIL)
0.2 - 0.6	Loose to medium dense orange brown slightly clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone (TRANSITION ZONE)
0.7 3.3	Medium dense to dense brown very sandy fine to coarse sub-rounded to rounded GRAVEL with some cobbles and occasional broken boulders of grey sandstone. Becoming damp at 2.1m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 2.8m.
2. Slight groundwater ingress at 2.8m.

TRIAL PIT 39 — Approx Ground Level = 32.7m AOD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly sandy SILT with many roots. (TOPSOIL)
0.2 - 0.7	Loose to medium dense slightly clayey SILT with occasional medium and coarse sub-rounded gravel of grey sandstone. (TRANSITION ZONE)
0.7 - 3.1	Medium dense to dense brown very sandy fine to coarse sub-rounded to rounded GRAVEL with some cobbles and occasional broken boulders of grey sandstone. Becoming damp at 2.4m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit slightly unstable below 2.8m.
2. Slight groundwater ingress at 2.6m.

TRIAL PIT 40 — Approx Ground Level = 32.7m AOD

Depth (m)	Strata
0.0 - 0.3	Loose dark brown slightly clayey SILT with many roots. (TOPSOIL)
0.3 - 1.1	Medium dense orange brown silty very sandy fine to coarse sub rounded to rounded GRAVEL with some cobbles of grey sandstone. (TRANSITION ZONE)
1.1 - 3.0	Medium dense to dense brown very sandy fine to coarse sub rounded to rounded GRAVEL with some cobbles and occasional broken boulders of grey sandstone. Becoming damp below 2.1m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit collapsing below 2.4m.
2. Slight to moderate groundwater ingress at 2.5m.
3. Bulk sample taken at 2.2m.

TRIAL PIT 41 — Approx Ground Level = 28.7m OAD

Depth (m)	Strata
0.0 - 0.2	Loose dark brown slightly clayey SILT with many roots (TOPSOIL)
0.2 - 0.8	Loose to medium dense orange brown very clayey SILT with some fine to coarse sub-rounded gravel of grey sandstone. (ALLUVIUM)
0.8 - 3.5	Medium dense brown very sandy fine to coarse sub-rounded to rounded GRAVEL with some cobbles and occasional broken boulders of grey sandstone. Becoming medium dense to dense at 1.5m. Becoming damp at 2.5m. (GLACIAL SAND AND GRAVEL)

Notes

1. Sides of pit slightly unstable to 0.8m
2. Moderate groundwater ingress at 3.4m.

CONTENTS

1 INTRODUCTION

During August 2005 Soil Mechanics (SM) were commissioned by Ove Arup and Partners (Arup), on behalf of Welsh Development Agency (WDA), to carry out a ground investigation at Pencoed Technology Park. The investigation was required to obtain geotechnical information for the proposed building development.

The scope of the investigation, which was specified by Arup, comprised trial pits with in situ testing and laboratory testing. The investigation was carried out in accordance with the contract specification and relevant standards (see References). The fieldwork was carried out between 22nd and 25th August 2005.

This report presents the factual records of the fieldwork and laboratory testing

No information regarding any previous ground investigation covering the site was forwarded to Soil Mechanics by Arup.

2 THE SITE AND GEOLOGY

2.1 The Site

Pencoed Technology Park is situated approximately 1.5km east of the town of Pencoed in South Wales. The site is at National Grid reference SS 971 810, see Site Location Plan in Enclosure D.

The site covers an area of approximately 65 hectares and comprises generally flat undeveloped farm land. The site has no boundary conditions.

2.2 Published Geology

The published geological maps covering the site, BGS Sheet 261 and 262 Bridgend (1974) shows the solid geology to comprise Triassic mudstones overlain by superficial deposits comprising River Gravels.

3 FIELDWORK

3.1 General

The fieldwork was carried out in general accordance with BS 5930 (1999) and Part 9 of BS 1377 (1990).

The trial pit and in situ test locations were selected by Arup as shown on the Exploratory Borehole Location Plan in Enclosure D. The locations were set out from local features by Arup. Trial pit co-ordinates as shown on the logs have been supplied by Arup.

3.2 Exploratory Holes

The exploratory holes are listed in the following table.

SUMMARY OF EXPLORATORY HOLES

TYPE	QUANTITY	MAXIMUM DEPTH (m)	REMARKS
Trial Pits	35	4 50m	Designated TP101 to TP135

The trial pits were logged and photographed by Arup. The trial pit logs presented in Enclosure A have been supplied to SM by Arup for inclusion in this report.

The records provided by Arup show descriptions of the materials encountered and details of the samples taken, together with observations made during trial pitting. No photographs of the trial pits have been passed on to SM by Arup for inclusion in this report.

On completion of the fieldwork all geotechnical samples were transported to the Bridgend laboratory of SM for temporary retention and testing.

3.3 Instrumentation and Monitoring

There was no requirement for any instrumentation or monitoring of any of the trial pits.

3.4 In Situ Testing

The hand vane testing enclosed in Enclosure B was carried out by Arup and issued to SM for inclusion in this report.

Other in situ testing was carried in accordance with BS 5930 (1999) and Part 9 of BS 1377 (1990) unless otherwise stated. The testing is summarised below and the results are presented in Enclosure B.

SUMMARY OF IN SITU TESTING

TYPE	QUANTITY	REMARKS
California Bearing Ratio	11	Carried out in Trial Pits TP101 to TP111

4 LABORATORY TESTING

4.1 Geotechnical Testing

The testing was scheduled by Arup and was carried out by SM at the Bridgend laboratory in accordance with BS 1377 (1990) unless otherwise stated. The testing is summarised below and the results are presented in Enclosure C.

SUMMARY OF GEOTECHNICAL LABORATORY TESTING

TYPE	REMARKS
Moisture Content Determination	23
Atterberg Limit Determination	21
Particle Size Distribution Analysis	13
Sedimentation by pipette	13
pH and Water Soluble Sulphate Content of Soils	6
Dry Density / moisture content relationship using 4 5kg hammer	14

4.2 Geoenvironmental Testing

There was no requirement for any geoenvironmental testing.

Certificate of Analysis

Certificate Number	21-13021	*Issued:*	25-Jun-21
Client	GEO Site and Testing Services Ltd Unit 4 Heol Aur Dafen Ind Est Dafen Carmarthenshire SA14 8QN		
Our Reference	21-13021		
Client Reference	(not supplied)		
Order No	(not supplied)		
Contract Title	JG FRANCIS CIVIL ENGINEERING LTD		
Description	2 Soil samples.		
Date Received	21-Jun-21		
Date Started	21-Jun-21		
Date Completed	25-Jun-21		
Test Procedures	Identified by prefix DETSn (details on request).		
Notes	Opinions and interpretations are outside the laboratory's scope of ISO 17025 accreditation. This certificate is issued in accordance with the accreditation requirements of the United Kingdom Accreditation Service. The results reported herein relate only to the material supplied to the laboratory. This certificate shall not be reproduced except in full, without the prior written approval of the laboratory.

Summary of Asbestos Analysis
Soil Samples

Our Ref 21-13021
Client Ref
Contract Title JG FRANCIS CIVIL ENGINEERING LTD

Lab No	Sample ID	Material Type	Result	Comment*	Analyst
1864868	A 1	SOIL	NAD	none	Lee Kerridge
1864869	B 1	SOIL	NAD	none	Lee Kerridge

Crocidolite = Blue Asbestos, Amosite = Brown Asbestos, Chrysotile = White Asbestos. Anthophyllite, Actinolite and Tremolite are other forms of Asbestos. Samples are analysed by DETSC 1101 using polarised light microscopy in accordance with HSG248 and documented in-house methods. NAD = No Asbestos Detected. Where a sample is NAD, the result is based on analysis of at least 2 sub-samples and should be taken to mean 'no asbestos detected in sample'. Key: * - not included in laboratory scope of accreditation.

DETS cannot be held responsible for the integrity of samples received whereby the laboratory did not undertake the sampling. In this instance samples received may be deviating. Deviating Sample criteria are based on British and International standards and laboratory trials in conjunction with the UKAS note 'Guidance on Deviating Samples'. All samples received are listed above. However, those samples that have additional comments in relation to hold time, inappropriate containers etc are deviating due to the reasons stated. This means that the analysis is accredited where applicable, but results may be compromised due to sample deviations. If no sampled date (soils) or date+time (waters) has been supplied then samples are deviating. However, if you are able to supply a sampled date (and time for waters) this will prevent samples being reported as deviating where specific hold times are not exceeded and where the container supplied is suitable.

Soil Analysis Notes

Inorganic soil analysis was carried out on a dried sample, crushed to pass a 425µm sieve, in accordance with BS1377.
Organic soil analysis was carried out on an 'as received' sample. Organics results are corrected for moisture and expressed on a dry weight basis.
The Loss on Drying, used to express organics analysis on an air dried basis, is carried out at a temperature of 28°C +/-2°C.

Disposal

From the issue date of this test certificate, samples will be held for the following times prior to disposal :-
Soils - 1 month, Liquids - 2 weeks, Asbestos (test portion) - 6 months

End of Report

Infiltration Test Report

Location: Plot E, Felindre Meadows Pencoed
Client: Fabco Phi 1 Ltd

Date:
12th September 2023

Weather:
Dry

Ground water table level:
Not encountered

Soil Conditions:
0.6m BGL - Medium dense reddish brown silty fine to course sand with occasional rounded cobbles of sandstone.

Comments:
All excavations carried out using JCB 3CX and 1500ltr water bowser.
Testing was carried out over a two day period to allow for saturation of each test hole.

UNEXPLODED BOMB RISK MAP

SITE LOCATION

Map Centre: 297177,180891

LEGEND

- **High:** Areas indicated as having a bombing density of 50 bombs per 1000acre or higher.
- **Moderate:** Areas indicated as having a bombing density of 15 to 49 bombs per 1000acre.
- **Low:** Areas indicated as having 15 bombs per 1000acre or less.

transport | **dock** | **Luftwaffe targets**
utilities | **Bombing decoy** | **other**

How to use your Unexploded Bomb (UXB) risk map?

The map indicates the potential for Unexploded Bombs (UXB) to be present as a result of World War Two (WWII) bombing.

You can incorporate the map into your preliminary risk assessment* for potential Unexploded Ordnance (UXO) for a site. Using this map, you can make an informed decision as to whether more in-depth detailed risk assessment* is necessary.

What do I do if my site is in a moderate or high risk area?

Generally, we recommend that a detailed UXO desk study and risk assessment is undertaken for sites in a moderate or high UXB risk area.

Similarly, if your site is near to a designated Luftwaffe target or bombing decoy then additional detailed research is recommended.

More often than not, this further detailed research will conclude that the potential for a significant UXO hazard to be present on your site is actually low.

Never plan site work or undertake a risk assessment using these maps alone. More detail is required, particularly where there may be a source of UXO from other military operations which are not reflected on these maps.

If my site is in a low risk area, do I need to do anything?

If both the map and other research confirms that there is a low potential for UXO to be present on your site then, subject to your own comfort and risk tolerance, works can proceed with no special precautions.

A low risk really means that there is no greater probability of encountering UXO than anywhere else in the UK.

If you are unsure whether other sources of UXO may be present, you can ask for one of our **pre-desk study assessments (PDSA)**

If I have any questions, who do I contact?

tel: **+44 (0) 1993 886682**

email: **uxo@zetica.com**

web: **www.zeticauxo.com**

The information in this UXB risk map is derived from a number of sources and should be used in conjunction with the accompanying notes on our website: **(https://zeticauxo.com/downloads-and-resources/risk-maps/)**

It is important to note that this map is not a UXO risk assessment and should not be reported as such when reproduced.

*Preliminary and detailed UXO risk assessments are advocated as good practice by industry guidance such as CIRIA C681 'Unexploded Ordnance (UXO), a guide for the construction industry'.
